                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to an isolated and purified polynucleotide located on mouse chromosome 2, encoding histidine decarboxylase, comprising exons 1 to 12 to a total length of approximately 24kb. The present sequence is an exon/intron boundary from the histidine decarboxylase polynucleotide sequence of the present invention. Recombinant vectors containing the polynucleotide with at least one exon substituted by a drug resistance gene, preferably neomycin resistance are also claimed. The polynucleotide is used to produce histamine defective animal models for studying histamine related disorders in humans and to produce treatments for them.

This sequence represents a splice donor site that can be used in a VP16

Gene trap vector used in the method of the invention. The method is for

Getecting interaction between an endogenous protein of a cell and a test

protein. The cell contains a first DNA sequence encoding a reporter under

transcriptional control of a transcriptional regulatory element, and a

cell sequence that is expressed by the cell and which encodes a

first hybrid protein comprising a first transcriptional regulatory

control on the transcriptional regulatory element controlling

transcriptional of the first DNA sequence and, a transcriptional

confortses: (a) placing into the cell; and a test protein. The method

comprises: (a) placing into the cell; and a test protein. The method

comprises: (a) placing into the cell; and a sequence encoding a second TRP

which, when combined with the first TRP, will reconstitute a

comprises: (a) placing to and activating the transcriptional regulatory

clement controlling transcription of the first DNA sequence; and

(b) determining whether the reporter is expressed by the cell, as an

indicator of expression of a second hybrid protein comprising the second

TRP and an endogenous protein of the cell capable of interaction with the

crest protein. The method is used for the identification and

crest protein. The method is used for the identification and

arrivator domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Splice donor; VP16 gene trap vector; protein-cell interaction; detection; protein-protein interaction; transcriptional activator domain; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /*tag= a

This sequence represents a splice donor site that can be used in a VP16
gene trap vector used in the method of the invention. The method is for
detecting interaction between an endogenous protein of a cell and a test
cell contains a first DNA sequence encoding a reporter under
transcriptional control of a transcriptional regulatory element, and a
second DNA sequence that is expressed by the cell and which encodes a
first hybrid protein comprising a first transcriptional regulatory
protein moiety (TRP) selected from a DNA-binding domain that recognises a
binding site on the transcriptional regulatory element controlling
transcriptional of the first DNA sequence and, a transcriptional
activator functional in the cell; and a test protein. The method
comprises: (a) placing into the cell; and a test protein. The method
comprises: (a) placing into the cell; and a test protein second TRP
which, when combined with the first TRP, will reconstitute a
comprises of binding to and activating the transcriptional regulatory
element controlling transcription of the first DNA sequence; and
the cell, as an
indicator of expression of a second hybrid protein comprising the second
TRP and an endogenous protein of the cell capable of interaction with the
test protein. The method is used for the identification and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel plasmid comprising a cytomegalovirus (CMV) promoter transcriptionally linked with an interferon alpha region (IFN-alpha) coding sequence, and a growth hormone 3'-untranslated region (UTR). Sequences AA240412 and AA240413 represent synthetic 5' and 3' splice donor and acceptor sites respectively for generating a synthetic intron to be inserted into the plasmid of the invention. The plasmids can be used for treating a mammalian condition or disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New plasmids containing an interferon-alpha coding sequence, used for the treatment of a mammallan condition or disease, particularly cancer
                                                                                                                                                                                                                                                                 Gaps
characterisation of unknown genes according to protein-protein interactions or for identification of genes encoding transcriptional

This sequence represents a splice donor site that can be used in a VP16 gene trap vector used in the method of the invention. The method is for detecting interaction between an endogenous protein of a cell and a test protein. The cell contains a first DNA sequence encoding a reporter under transcriptional control of a transcriptional regulatory element, and a second DNA sequence char is expressed by the cell and which encodes a first thybrid protein comprising a first transcriptional regulatory protein moiety (TRP) selected from a DNA-binding domain that recognises a binding site on the transcriptional regulatory element controlling transcriptional of the first DNA sequence and, a transcriptional continuous in the cell; and a test protein. The method activator functional in the cell; and a test protein. The method activator functional into the cell a DNA construct comprising one or more mRNA splice sites, and a third DNA sequence encoding a second TRP which, when combined with the first TRP, will reconstitute a comprise of binding to and activating the transcriptional regulatory element controlling transcription of the first DNA sequence; and (b) determining whether the reporter is expressed by the cell, as an and order of the first DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TRP and an endogenous protein of the cell capable of interaction with the test protein. The method is used for the identification and characterisation of unknown genes according to protein-protein interactions or for identification of genes encoding transcriptional

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vaccular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fit-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (fik-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                            flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage;

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour amiglogenesis, ocular diseases, psoriasis and rheumatold arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; single nucleotide polymorphism; SNP; genotyping; DNA analysis; allet specific olligonucleotide; ASO; reduced complexity genome; RCG; genomic classification; identification; DNA fingerprinting; tumour characterisation; hybridisation; SS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecule modulating VEGF receptor(s) gene expression mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human genomic SNP allele specific oligonucleotide SEQ ID NO:102.

                                                                                                                                                                                                                                                                                                           A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis, AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to AAA35632 represent nucleotide sequences containing SNPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                             Detection of single nucleotide polymorphisms in genomes by preparation and analysis of reduced complexity genomes, useful for genotyping, fingerprinting and determining allele frequency of SNPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                       The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                             Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the generare useful for phenotypic correlations, forensics, paternity testing,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   δ
                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pwMax (gil4732114|gb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli xL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Importance Colon (mark) was obtained from the Jackson Imboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of PWD42 (gil4732114) [pl ARL29072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

double-stranded cDNA was size selected, ligated to Eco R adapters (Pharmacia), digested with Not I and cloned into the Not I and Eco Ri Sites of a modified pr773 vector (Pharmacia). Library went through one round of normalization to a Cot = 53. Library constructed by Bento Soares and M. Fatima Bonaldo. The adult brain RNA was provided by Dr. Donald H. Glann. Tissue was acquired 17-18 hours after death which occurred in consequence of a ruptured aortic aneurysm. RNA was prepared from a pool of tissues representing the following areas of the brain: frontal, parietal, temporal and occipital cortex from the left and right hemispheres, subcortical white matter,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ŏ
                                                                                                                                                                                  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gblaF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              EST 31-JUL-1995

was blunt end repaired with 74 bNA polymerase and 74 polymerase and repaired with 74 bNA polymerase and 74 polymerase ind 75 polymerase independent of 10.5 kb range using preparative agarose gel electrophoresis. Vector bNA was prepared from a derivative of pWD42 (gil4732114gb)AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse bNA was annealed to adaptored vector bNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Q
                        /note="Organ: pooled; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NDHL19W, testis NHT, and B-cell NCI_CGAP_GCBI) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified consols from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo. "

(http://www.jax.org/resources/documents/dhares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (qil4732114) plaFL29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the linest adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10.Gold (Stratagene) cells and selected for amplicillin resistance."
                                                                                                                                                                                                                                                                                   and Wright,D.,Weiss,R.
Mouse whole genome scaffolding with paired end reads from 10kb
plasmid inserts
